

## Cup Filling

### Serac launches the LINEA XS, an all-terrain filler for medium outputs

*The packaging specialist took the best of both its rotary and linear machines to design a cup filler that meets the investment constraints of medium-speed production: from 5000 to 12000 cups per hour.*

*The LINEA XS incorporates Serac's latest advances in terms of hygiene, ergonomics and flexibility in a refined design that makes installation and daily operation easier.*

*Having enticed food manufacturers in Western Europe, this new offer could also prove interesting in geographical areas where access to experienced technicians is difficult.*

*Pict 1: Transparent doors and frameless design for better visibility of the LINEA XS*

### Uncompromising filling hygiene

The LINEA XS guarantees environmental control through a unidirectional laminar flow installed above filling operations.

It can be combined with H<sub>2</sub>O<sub>2</sub>, UV or pulsed light decontamination modules, depending on the level of bacteriological reduction required and the environmental goals aimed at.

It also benefits from a new electric dosing nozzle developed by Serac, which is cleaner and more versatile.

### Simplified and compact design for better TRS

The LINEA has a design that combines simplicity, efficiency and scalability. From mechanical drives or servomotors to stations that can be moved as needed, with a reduced footprint, the LINEA XS is designed to offer a flexible and a reliable production tool.

### Maximum ergonomics for the operator

With a lowered chassis, storage stations within arm's reach and a design that provide increased visibility on the filling functions, the LINEA XS offers true working comfort to the operator in charge of running it.

### **Shipped ready to install**

Compact, the LINEA XS can be shipped in a container without having to be dismantled and disconnected. It thus provides enhanced trust and speed upon installation, for trouble-free production start-ups, even in geographical areas where technical skills are scarce.

*Available for stackable and non-stackable cups, the LINEA XS can also be combined with a cup blower in the CUPBOX block variant.*

*Pict 2: Lowered chassis for storage stations within arm's reach*
